Example 1: Let's consider a gene with only two alleles. In mice, Black fur color (BB or Bb) is dominant to brown fur color (bb). In a population of 100 mice, 36 mice are homozygous dominant (BB), 48 mice are heterozygous (Bb) and 16 are brown (bb). Relative frequency of B =  $\frac{\# \text{ of B alleles in the population}}{\# \text{ of TOTAL alleles in the population}}$

Figure 16-1 There are two main sources of genetic variation: mutations and the gene shuffling that results from sexual reproduction. Each of these babies has inherited a collection of traits. Some, such as hair color, are visible, while others, such as the ability to resist certain diseases, are not. Section 16-1 SECTION RESOURCES Print: □ Laboratory Manual A, Chapter 16 Lab
