adapt their own structure and functioning while remaining viable. But many researchers would argue, rightfully, that intelligence involves more than survivability.

When are robots intelligent autonomous agents? - ScienceDirect

An autonomous intelligent agent is an intelligent agent that is free to choose between different actions. As the term 'artificial' suggests, the sort of autonomous intelligent agents of interest to us here are not the sorts of things we find in the wild. Rather, they are created.

Introduction to Intelligent Agents - The Mind Project

The MAS operates as an intermediary between users and services and is composed of three different types of autonomous agents, which are (1) service-representative agents (i.e. "Provider Agent", "Service Agent" and "Robot Agent"), (2) user-representative agents (i.e. "Customer Agent", "Discovery Agent" and "Selection Agent"), and (3) system-management agents (i.e. "Framework Agent" and "Broker Agent").

An intelligent framework to manage robotic autonomous agents
In artificial intelligence, an intelligent agent (IA) refers to an autonomous entity which acts, directing its activity towards achieving goals (i.e. it is an agent), upon an environment using observation through sensors and consequent actuators (i.e. it is intelligent). Intelligent agents may also learn or use knowledge to achieve their goals.

Intelligent agent - Wikipedia

A multi-agent system (MAS or "self-organized system") is a computerized system composed of multiple interacting intelligent agents [citation needed]. Multi-agent systems can solve problems that are difficult or impossible for an individual agent or a monolithic system to solve. Intelligence may include methodic, functional, procedural approaches, algorithmic search or reinforcement learning.
