In engineering mechanics an arrangement of rigid members connected in certain patterns is called as a structure. A bridge, a communication tower and frame of an automobile all are structures. Mechanisms and machines in static configuration, when the forces are balanced and there is no motion, are also analyzed for force interactions under Statics in Engineering Mechanics.

Statics is the branch of mechanics that is concerned with the analysis of loads (force and torque, or "moment") acting on physical systems that do not experience an acceleration ($a=0$), but rather, are in static equilibrium with their environment. The application of Newton's second law to a system gives: $\sum \mathbf{F} = 0$. Where bold font indicates a vector that has magnitude and direction.
