Structural vibration occurs when forces generated by machines such as compressors, pumps, chillers and air handling equipment, causes the structural steels to vibrate. Consequently, this can prompt equipment failure, noise transfer and most importantly, safety concerns. The vibration is due to the structure being mechanically resonant.

Vibration is a mechanical phenomenon whereby oscillations occur about an equilibrium point. The word comes from Latin vibrationem ("shaking, brandishing"). The oscillations may be periodic, such as the motion of a pendulum—or random, such as the movement of a tire on a gravel road. Vibration can be desirable: for example, the motion of a tuning fork, the reed in a woodwind instrument or harmonica, a mobile phone, or the cone of a loudspeaker. In many cases, however, vibration is ...
